TABLE MEMORY · UGREEN HACKATHON 2026 · BRING MEMORIES TO LIFE

Local rehearsal proof

Synthetic family recipe box: two jollof versions, one blurred quantity, one PDF and one voice note. Every result below is a local rehearsal, not a UGOS or NAS run.

Claim boundary: this proves the local worked example and the generated artifact. It does **not** prove that the UGOS Skill executed, nor UGOS OCR/VLM quality, delegate calls, permission prompts, NAS saving or NAS read-back. Those remain finalist tests.

JOLLOF RICE — MAMA

family recipe card

2 cups long grain rice

1/2 cup groundnut oil

3 tbsp tomato paste

1 tsp salt

Source A: `fixtures/jollof-mama.png` · blurred red-pepper line · SHA-256 29d742…42c68

JOLLOF RICE — AUNTY

family recipe card

2 cups long grain rice

1/4 cup groundnut oil

3 tbsp tomato paste

1/2 cup red pepper

1 tsp salt

Source B: `fixtures/jollof-aunty.png` · clear red-pepper line · SHA-256 2276ce…d8130e

Branch table — the product difference

Branch	Oil	Red pepper	Status
Mama	1/2 cup	line present but blurred; no quantity readable	needs review
Aunty	1/4 cup	1/2 cup	complete

The versions are kept separately. No average, merge or overwrite. The cook chooses which edition to use.

One focused question

How much red pepper did Mama use?

The fixture question targets the one missing detail only; no model execution is claimed. It accepts `I do not know` or `skip`. A fixture answer becomes an attributed note, never a verified card value.

> **Fixture answer:** “One cup, blended.” — *attributed*, not source.

Second session — a correction that survives

`session2.cjs` reopens `run/correction-record.json` — a list that can hold none, one or several corrections, each with an ingredient or step locator. It recomputes the Mama fingerprint, reuses the approved clarification as **approved_correction**, and keeps it out of Aunty’s branch. A changed-source run rejects the same record, and `verify-readback.cjs` checks the saved files byte-for-byte.

Generated cookbook excerpt

Original evidence: the card’s red-pepper line remains blurred and unreadable. **Approved clarification:** “One cup, blended.” is attributed to the fixture respondent and supplies the working quantity for Mama’s version; the source value is not rewritten.

Mama branch	Aunty branch
2 cups rice · 1/2 cup oil · 3 tbsp tomato paste · red pepper needs review (line present but blurred) · 1 tsp salt · 2 cups stock Voice note: “Mama always used the big pot…” — transcript with source reference. Respondent recall: “One cup, blended.” — attributed.	2 cups rice · 1/4 cup oil · 3 tbsp tomato paste · 1/2 cup red pepper · 1 tsp salt · 2 cups stock Family note: “fry the pepper until it separates from the oil.”

Shopping list — exact scaling from a stated yield

Coconut Rice PDF states **4 servings**; scaling to **6** is 1.5×. This is a fixed fixture example, not a general scaling engine. The jollof cards state no yield, so they are not scaled.

Ingredient	Original (4)	Scaled (6)
long grain rice	2 cups	3 cups
coconut milk	1 cup	1.5 cups
stock	1 cup	1.5 cups
small onion	1	1.5 small onions (buy 2)
salt	1 tsp	1.5 tsp
oil	1 tbsp	1.5 tbsp

Checks

PASS two branches preserved separately
PASS blurred red-pepper line flagged `needs_review`, not invented
PASS fixture answer recorded as *attributed*, not source
PASS every source has a SHA-256 fingerprint in the provenance index
PASS shopping list built before saving; scaling uses the stated 4-serving yield
PASS first-session and second-session scripts included with captured outputs and traces
PASS correction record reopened by a separate script; hash and field matched
PASS changed source rejected; correction kept out of Aunty’s branch; saved files read back
PASS jollof not scaled because no yield was stated
NOT PROVEN UGOS delegate calls, OCR/VLM quality, audio transcription, permission prompts, NAS save/read-back

What was actually run

- Local `tesseract` OCR on the two card images; PDF text with `pdftotext`.
- Synthetic voice note generated with ElevenLabs TTS through the local `sag` client; transcription used the ElevenLabs Scribe v2 hosted API from a local script. Both are rehearsal tools, not UGOS services.
- First-session generation (`controller.cjs`); second-session reopen (`session2.cjs`); changed-source rejection; read-back verification (`verify-readback.cjs`). No UGOS expert, NAS, permission prompt, actual human interaction or model question-selection ran.
- Artifacts: `run/cookbook.md`, `run/correction-record.json`, `run/session-2.md`, `run/session-2-checks.json`, `run/readback.json`, `run/checks.json`.
